

DISPOSABLE SLIPPER

ABSTRACT OF THE DISCLOSURE

5 A disposable slipper and associated method are provided. The slipper is
structured to be adhered to a human foot to protect the foot, for example, during salon
and spa procedures such as pedicures. The slipper includes a flexible base layer with a
peripheral edge that generally defines an outline of a human foot. A releasable
hypoallergenic adhesive is disposed on a first side of the base layer so that the slipper can
be adhered to a bottom of the foot. A second side of the base layer, opposite the first
10 side, is directed away from the foot and defines a sole of the slipper.
